

Why should you automate? We give you 15 Reasons

Bank Statement Automation

in Microsoft Dynamics 365 for Finance and Operations

Are you still spending time processing Bank Statements and Reconciliation manually?

The Bank Statement and Reconciliation process is a dreaded task by most Finance and Account Team members.

The task of ensuring that your Bank Accounts and General Ledger balances are in sync sounds simple.

But, ensuring that there are no inaccuracies can often be a daunting task whether you work

with one bank account, or hundreds.

The process can be much like finding a needle in a haystack.

Just a few Euros or Dollars off here and there in any given transaction, or, missing payment advise/remittance information can make it a near impossible task to find the correct match and correction among thousands

of transactions.

If you do not have an intelligent solution enabling automation, the task becomes manual, slow, and costly.

For Accounting, Finance and Treasury Teams that oversee numerous legal entities, who work with multiple banks, and oversee numerous bank accounts, the cost of manual handling increases significantly.

A black calculator is positioned in the foreground, partially overlapping a document. The document contains a table with two columns of numbers. The first column has values: 1 296 211, 1 839 317, 2 459 808, 3 227 076, 4 050 935, 5 28 231. The second column has values: 424 953, 446 211, 468 522, 491 948, 516 545, 542 372, 569 401. To the right of the table, there are labels: 'Investment' and 'Value at Year End'. Below the table, there is a circled value '35 414' and the text 'Start at monthly' and 'Can be done'.

We give you 15 reasons

to start automating today

1. Save time and Money

Time saved = Cost Saved. Even companies with only a few bank accounts often drastically underestimate the effort that is truly spent on the bank statement import and reconciliation process.

Configuring and automating the process is a quick and inexpensive exercise compared to the gain. And, once it has been set you don't have to look back!

2. Primed for growth

As your company and number of transactions grow, easily add new bank accounts and new bank connections. With a "plug and play" solution, adding new bank providers, bank accounts, and bank statements for processing is a breeze. Set yourself up for growth!

3. Operate independently of your bank

You can switch your bank(s) without the risk of losing your automation. Switch bank provider, add and change bank accounts without worrying about your internal efficiency.

Make sure to choose a solution that offers true global bank connectivity. This gives you maximum flexibility to make the optimal business decisions for your company in any region.

4. Is your current process secure?

Avoid printouts and manual downloads of sensitive company data. This only adds significant risk.

Lock down and secure the process. Control access with server side control. Full history of all communication is logged and stored.

With the right solution, communication is handled safely and directly between your Microsoft Dynamics ERP and your bank(s).

5. Make human errors history

When working with large data and transactions volumes, human mistakes happen. With an automated process you avoid frustrating typos and the risk of transposing numbers.

6. Reconcile daily, automatically

Increase the cadence of reconciliation to a daily process! Run the process in the background, let the intelligent solution do its job. You will only attend to true exceptions needing human intervention.

Do not save the daunting task till the end of the month, instead, be current every day.

7. Handle exceptions automatically

By leveraging the matching and mapping rules, an automated reconciliation pro-

cess can handle complex exceptions which would otherwise require human intervention.

Bank fees, currency exchange rate conversions, transaction amount differences can all be handled automatically as you apply these rules. Fine-tuning the rules over time will only increase efficiency further.

8. You bank balances are always current

By running automatic bank reconciliation daily, your company's bank balances are immediately current. This provides a much improved overview for the CFO and/or Treasurer, of the actual cash availability across all legal entities, and all bank accounts within the company.

9. Enterprise-wide = massive efficiency gain

The automatic reconciliation process is applicable across any size organization. From SME's to true global Enterprises. The solution will cover an unlimited number of banks, bank accounts, legal entities and currencies.

10. Process standardization = efficiency

Leveraging a Microsoft Dynamics 365 ERP certified add-on solution will be a great tool for shared services teams, leveraging the same solution features, benefit from the same process standardization and training.

11. Correct errors much faster

As the automatic process handles the majority of the transactions, you will deal with only a limited number of exceptions and issues.

With an improved overview, you can drill right into the specific transaction for immediate investigation and correction.

12. Your time is valuable, focus!

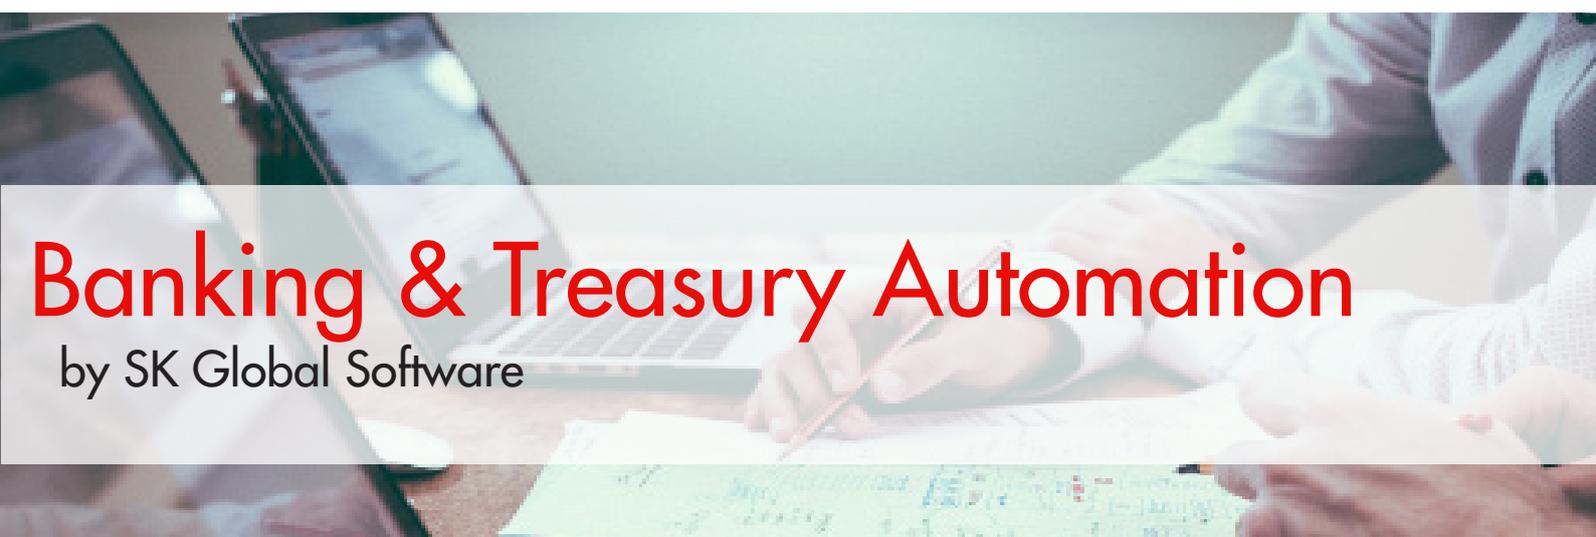

Deal only with true exceptions. Your time is now spent handling only valuable tasks that truly do need your attention.

13. Process large data quantities, fast!

An intelligent and automated process makes it possible for very few individuals to handle very, very, large quantities of data painlessly. We like high performance!

14. Removing dreary, manual work ... Makes your employees happier!

15. Be Audit-ready with high data integrity The combination of the secure data flow, a daily reconciliation process, and fast correction of errors and exceptions will increase your company's data integrity ensuring that you are audit ready anytime.

Banking & Treasury Automation

by SK Global Software

We are here to help

In a modern ERP system such as Microsoft Dynamics 365, you are not left to do your bank reconciliation manually if you are able to electronically import your bank

statement file from your bank.

Easily handle the most common bank statement files such as MT940, ISO20022, BAI2,

and more. Do you work with a local file format? No problem, we will cover you here too. When the bank statements are electronically and automa-

tically imported, then the process almost becomes enjoyable!

You can check and validate transaction types between your General Ledger and bank statement file. Using our advanced rules, you can perform transaction matches,

account for amount differences, tolerance variables and more.

Quickly create ledger transactions automatically, for instance for those annoying bank fees.

This is all being done within

Microsoft Dynamics 365 for Finance and Operations, leveraging SK Global Software's Add-On solution.

Trust a Dynamics 365 Add-On

Used by + 1,500 Microsoft Dynamics ERP Organizations

What if the entire process, from end to end, was a completely automated process?

A process which only needed your attention if a few transactions did not match.

You would be saving yourself time, you would save your company money, and

eliminate human errors. This is an easy area to increase efficiency for any Microsoft Dynamics 365 ERP organization!

In order to enjoy close to 100% Bank Statement and Reconciliation Automation in Microsoft Dynamics 365 for Finance and Operations, you will need a certified Add-On Solution

that goes above and beyond the standard functionality.

You should consider a certified and trusted Add-On solution, built specifically to handle Bank Statement Automation in Microsoft Dynamics 365, and being used by more than 1,500 Microsoft Dynamics ERP organizations globally.

Enjoy the benefits today

Easily installed, configured, and put to use

- Easily deployed, installed and configured
